

An attempt to use the MaTeX command that I saw in a stackexchange post. Found that external packages were required, and didn't take the effort to install those.

Saw a sample of this on stack overflow:

<https://mathematica.stackexchange.com/questions/161219/matex-and-phantom?newsletter=1&nl-code=73476%7cac46>

This doesn't appear to be a built in package, but requires:

<http://szhorvat.net/pelican/latex-typesetting-in-mathematica.html>

```
<< MaTeX`
```

```
Inset[MaTeX["\\sqrt{a^2b}", Magnification -> 5], {0, 0}] // Graphics
```
